My Fix Log (Based on AI Audit & Manual Review):

- **1. Mobile Layout (Horizontal Overflow):**
 - *What was broken:* On mobile widths, some fixed containers and absolute widths were causing a slight horizontal scrollbar, breaking the responsive layout.
 - *What I changed:* I refactored the CSS, replacing rigid widths with a safer responsive pattern (`width: 100%; max-width: 1200px;`) and applied proper padding to keep all content strictly within the mobile viewport.
- **2. Mobile Navigation (Hamburger Menu):**
 - *What was broken:* The desktop navigation links were squished and untappable on smaller screens, creating a poor user experience.
 - *What I changed:* I implemented a responsive hamburger menu using CSS media queries and vanilla JavaScript, ensuring navigation is hidden behind a clean, easily tappable icon on mobile devices.
 - before

after

- **3. Performance (Image Loading):**

- *What was slow:* My portfolio contains large visual assets. Loading all project imagery at once was unnecessarily taxing the system and slowing down the initial render on mobile networks.
- *What I changed:* I added the `loading="lazy"` and `decoding="async"` attributes to all images below the fold, while keeping the hero image prioritized. This significantly improved the initial load time and overall site performance.
