My Dynamic Feature: A Live Contact Form

What is a backend? If the frontend (my website) is the dining room of a restaurant where people see the menu, the backend is the kitchen. It is the unseen mechanism behind the walls that takes a user's request, processes the raw data, executes logic, and safely delivers the final result.

What my feature does: It allows visitors to send me a direct message from my static Vercel portfolio without needing to open their own email app.

How the data flows (End-to-End):

1. The user types their message into the HTML form on my portfolio and clicks "Send" (Frontend).
2. My JavaScript code intercepts this action and sends a POST request containing the data over the internet to a free-tier API service (Web3Forms).
3. The API acts as my backend server. It receives the data payload, authenticates my unique access key, formats the message, and securely routes it.
4. Finally, the server pushes the data into my personal inbox as a readable email, completing the cycle.
