

Build Log: Dataset Scout Agent

Iteration 1 (Initial Setup & Test):

- Implemented the strict system prompt emphasizing web search and zero hallucinations.
- Ran Eval Case 1: "Find a YOLO format dataset on Roboflow for detecting ground obstacles and potholes."

Observations & Agent Behavior:

- Success: The agent successfully executed the search tool and returned 100% valid, active URLs. No 404 errors or hallucinated links were generated.
- Deviation from Spec: My initial assumption in the design phase was that the agent would find one single, perfect dataset containing both classes. However, the real-world data landscape didn't have a unified dataset of high volume.
- Adaptation: Instead of forcing a fake answer or failing, the agent adapted intelligently. It provided one dataset for "potholes/defects" and another for "general obstacles", explicitly suggesting a professional ML workflow: merging them using Roboflow's tools.
- Decision: I am keeping this behavior. The guardrails worked perfectly (it refused to guess), and the agent provided a better engineering solution than a single limited dataset. The core job is functionally complete and ready for the MVP stage.
