My "Where it breaks" & Hardening Report:

1. Stress Testing & The "Fix-Nows" (Evidence of Fix):

- *What broke:* I tried to break the contact form by bypassing the HTML `required` attributes. I filled the inputs using only empty space characters (pressing the spacebar). The frontend accepted this garbage data and successfully submitted a blank message to my backend.
- *How I fixed it:* I classified this as a "fix-now". I updated the JavaScript handler to sanitize inputs using the `.trim()` method before executing the `fetch` request.
- *Code Evidence:*

```
const nameVal = document.getElementById('name').value.trim(); if (!nameVal) { return; // Blocks submission if empty }
```

2. Known Limitations (Honest Triage):

- *Spam Vulnerability:* The Web3Forms endpoint currently lacks a CAPTCHA integration. A malicious bot could potentially scrape the site and submit spam emails. I am accepting this limitation for now to maintain a frictionless user interface, but I will monitor my inbox for abuse.

3. Findability & Basic SEO (Evidence of Implementation):

- *What I added:* I injected comprehensive meta tags into the document `<head>`, including standard descriptions, Open Graph (`og:title`, `og:image`), and Twitter Card data. The portfolio now generates a professional rich preview card when shared on platforms like LinkedIn or WhatsApp.

4. Speed Check (Evidence of Speed):

- I ran a live Google PageSpeed Insights check. The performance remains highly optimized due to the `loading="lazy"` attributes implemented in previous builds.
- *Mobile Audit:*
