

1. Proof Statement: I am a Software Engineer who builds clean, user-friendly, and scalable digital products.

2. Reviewer Feedback & The 10-Second Test: I asked a reviewer to look at my site.

- **10-second test:** They clearly saw "Software Engineer" in the hero section, but they noted it wasn't immediately clear *what technologies* I use or my specific focus until they scrolled down.
- **Believability:** They believed in my technical skills because the site is fast, modern, and all features (like the CV download and hover effects) work perfectly. However, they felt the project section listed what I built, but not necessarily the *specific use-case or problem solved* by each project.

3. Triage: I listened without defending and sorted the feedback honestly:

● **Must-Fix:**

- **Immediate Tech Clarity:** The hero section needs to explicitly show my tech stack right under my title so recruiters know my stack in the first 3 seconds.
- **Project Context:** The projects need specific descriptions explaining *what they are used for*, not just their names.

● **Nice-to-Have:**

- **A "Back to Top" button:** Since the portfolio will grow as I add more projects, a sticky scroll-to-top arrow in the bottom corner could improve navigation.
- **Subtle Page Transitions:** Adding soft fade-in animations when scrolling down to the projects section.

4. What I Changed: I went back to my code and fixed the must-haves:

1. I explicitly added the technologies I know right below the "Software Engineer" title on the main page for immediate clarity.
2. I updated the descriptions in the Projects section to clearly state the specific use-cases and what each project is actually used for. My updated live site is here: [Web Site](#)
