

How I will add my next case study: Since my portfolio is already structured and hosted on GitHub, my workflow will be:

1. Pull the latest repository from GitHub to my local environment.
2. Open my saved AI Workspace (which already knows my tone and stack) and feed it my raw project notes to generate a case study using the strict three-beat shape:
 - **The Problem:** The specific challenge the project addresses (e.g., accessibility hurdles for the visually impaired).
 - **What I did:** The core goal of the project, the engineering execution, and the comprehensive list of technologies used.
 - **What came of it:** The final impact, solution, or measurable outcome provided.
3. Add this structured case study into the "Projects" section of my codebase.
4. Commit, push the updates, and let it redeploy automatically.

My Next Case Study: I will add the "**Gözlük**" (**Glasses**) project. This is a computer vision and image processing application specifically designed to assist visually impaired individuals.

Evidence of the Reminder Set:

Context Preservation: My AI Project context is preserved. The AI already has my identity kit and portfolio layout stored, meaning this next update will be a fast, iterative conversation rather than a time-consuming manual rebuild.
